

Current Radar and Satellite Data

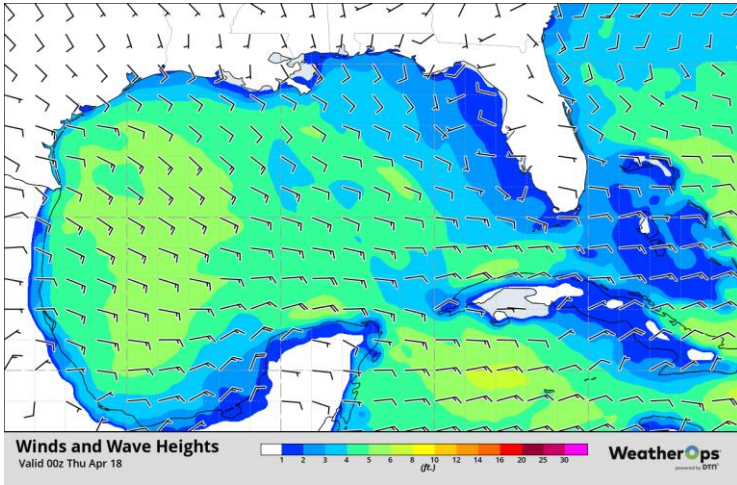

Today and Tomorrow's Weather

Mainly dry conditions continue across the region for today with only a few isolated showers expected across the western Gulf. For today, winds and seas will be at moderate levels with 2-5 foot seas. Weak ridging over the southeastern US may interact with an approaching trough and create a weak stationary boundary along the gulf coast on Friday though only a few showers look to result from this. For Friday, most of the basin will see gentle to moderate winds with slight to moderate seas.

Day Three through Seven Weather Hazards

A potential frontal boundary will impact the northern basin sometime late overnight Saturday into early Sunday morning, bringing an elevated risk for thunderstorms to offshore regions in the northern gulf. The frontal boundary will depart the region by early next week leaving mostly dry conditions across the region, however a few isolated showers and storms will be possible across the western Gulf. Winds will gradually shift to being out of the north, with gusts to 30 knots possible along with moderate seas. By mid-week next week, drier conditions are expected to return across the region although some isolated showers and storms may be possible at times along with locally enhanced winds and seas.
